

User Test #001

This is a test of audio levels. That's good. Please state your name and give your consent.

Emely Giraldo. I consent.

All right. So if you were to use Loading.js, how would you go about using it?

Um, well, I probably go through the docs I guess like if there's documentation that I probably just go through that and you know fill in the stuff if I need something.

Nice. Um, can you create a simple loader using the dots and the demo page?

Yeah [time passes] what is this?

Uh, speed, check the docs. [time passes] Alright perfect example -

This is so cute!

Obviously, it's it's so small. That's what happens when you put 3 pixels in so for example now take out uh colors real quick for me and then click test again these errors help you at all to determine what's wrong with what you put in?

Yeah, they do. I like them.

Um, let me check what the next question is. What would you change if anything to make this more suitable to your situation/use?

I like the - I like the parameters like they seem fine like everything -

Would you change anything with the docks for the help?

I mean if they seem pretty short, so [pause] I mean some people like, you know, people are at different levels of you know, Building Products. So broader documentation. Is always good in my book.

Gotcha. Is there any controls that you wish to be or not be there?

You asking me about like the stuff that you have?

Yeah, there was something that you wish you could add or something that wasn't there or it seems unnecessary?

No. I think they're all reasonable. I think you got everything that everything is and have any questions remaining anything left. I could answer for you or any suggestions on this and I think you did a good job. I like this error handling like the even like the, you know example usage thing in the docks small, but they're good. They're concise.

Awesome. Thank you very much.
